Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Accra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Salvador and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical

geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across New Delhi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Bengaluru and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Port Said and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across New York and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Sapporo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local

stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Wellington and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Berlin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Córdoba and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Port Moresby and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and

local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Vancouver and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Nagoya and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Edmonton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Lae and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography

perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Trujillo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mar del Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Tokyo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Washington, D.C. and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Sapporo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local

stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Birmingham and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Port Moresby and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Nice and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time,

cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Perth and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Chicago and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Guangzhou and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Rio de Janeiro and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Berlin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Monterrey and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Shenzhen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Phoenix and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Canberra and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Calgary and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Belfast and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Takoradi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across New Delhi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Guadalajara and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network

connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Trujillo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Nairobi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Brisbane and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Osaka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Córdoba and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply,

hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Tamale and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Stuttgart and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Paris and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Christchurch and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Shanghai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Edinburgh and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Cologne and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map

flood exposure across Fukuoka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Brasília and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Liverpool and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Guadalajara and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Mombasa and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Glasgow and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Córdoba and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Nakuru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Hamilton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Marseille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood

exposure across Tamale and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Accra and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Mumbai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Sapporo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Ottawa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Bengaluru and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Hamilton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Kolkata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Tema and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across São Paulo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Hyderabad and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across La Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Córdoba and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A

planner might map landslide exposure across Madang and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Mar del Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Manchester and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Puebla and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Yokohama and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Berlin and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Edinburgh and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Cusco and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Córdoba and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Tauranga and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Yokohama and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Nakuru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Nakuru and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map flood exposure across São Paulo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Nagoya and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Puebla and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Kolkata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Córdoba and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Calgary and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Mar del Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Malindi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Lima and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Cairo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Fukuoka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Cape Coast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map

earthquake exposure across Chennai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Nice and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Giza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Belfast and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Hamilton and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method

focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Nairobi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Sapporo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across London and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Cape Coast and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Lae and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Port Said and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Goroka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Port Moresby and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Kumasi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave

exposure across Trujillo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across León and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Beijing and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Nice and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Vancouver and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Manchester and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Rio de Janeiro and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Mexico City and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Chiclayo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Chennai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Fukuoka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Guadalajara and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide

exposure across Beijing and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Iquitos and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Wuhan and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Vancouver and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Paris and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Rio de Janeiro and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Chengdu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Chennai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across São Paulo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Frankfurt and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Belfast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Beijing and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Los Angeles and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave

exposure across New Delhi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Lille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Lyon and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Belo Horizonte and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Tokyo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Mexico City and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Malindi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Marseille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Shenzhen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Madang and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Bengaluru and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Wellington and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Alexandria and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map

flood exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Toronto and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Washington, D.C. and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across London and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Sydney and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Paris and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Bristol and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Hamburg and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Hyderabad and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Montreal and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Edmonton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Leeds and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Suez and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide

exposure across Lille and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Cairo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Hamburg and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Chiclayo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across León and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Kumasi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Chicago and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Tokyo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Hamilton and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Fortaleza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Canberra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Osaka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Arequipa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake

exposure across Port Said and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Sapporo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Sapporo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Cape Coast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Brisbane and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Mount Hagen and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Bengaluru and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Sydney and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Washington, D.C. and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across La Plata and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Trujillo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave

exposure across Frankfurt and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Mexico City and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Port Said and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Los Angeles and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Munich and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Hyderabad and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Dunedin and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Chiclayo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Cardiff and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Giza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Lima and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Tijuana and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Leeds and test how transit-oriented development changes expected

losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Manchester and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Adelaide and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Auckland and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Cairo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Puebla and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Mar del Plata and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Chengdu and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Shanghai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Sydney and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Calgary and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Eldoret and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Paris and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide

exposure across Beijing and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Fukuoka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Adelaide and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Nagoya and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Córdoba and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Auckland and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Lima and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Houston and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Toulouse and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Vancouver and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Frankfurt and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Adelaide and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner

might map heatwave exposure across Brisbane and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across London and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Kolkata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Birmingham and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Frankfurt and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Lima and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Cape Coast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Belo Horizonte and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Cusco and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Yokohama and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Marseille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Melbourne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Calgary and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner

might map flood exposure across Houston and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Rosario and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Hamburg and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Tokyo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Fortaleza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Mendoza and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Salvador and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Rosario and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Frankfurt and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Houston and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Edinburgh and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

flood exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tamale and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Liverpool and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across São Paulo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Cape Coast and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Auckland and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Tijuana and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Sydney and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Kisumu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Nice and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Leeds and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Beijing and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities

specialize. Applied note: A planner might map drought exposure across Buenos Aires and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across São Paulo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Arequipa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Stuttgart and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Salvador and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Washington, D.C. and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Hamilton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across London and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Tamale and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Marseille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Kolkata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Rosario and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Iquitos and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Fukuoka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

heatwave exposure across Munich and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Sapporo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Port Moresby and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across La Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Belfast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Perth and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Perth and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Monterrey and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Salvador and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Shenzhen and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Kimbe and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Rosario and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Goroka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Wellington and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought

exposure across Bengaluru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Monterrey and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mexico City and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Shenzhen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Mendoza and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Beijing and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Wuhan and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across León and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Goroka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Wuhan and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Sapporo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Glasgow and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map

flood exposure across Arequipa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across São Paulo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Sydney and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Goroka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across León and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Sheffield and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Salvador and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Beijing and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Giza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Brasília and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Buenos Aires and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Yokohama and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

landslide exposure across Hyderabad and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Canberra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Stuttgart and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Kimbe and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Nagoya and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Melbourne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Madang and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Toronto and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Leeds and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Frankfurt and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Stuttgart and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Canberra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Kisumu and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Dunedin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

storm surge exposure across Stuttgart and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Mombasa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Chennai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Cusco and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Glasgow and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Tema and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Sydney and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Tamale and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Calgary and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Adelaide and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across New Delhi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Tauranga and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across

Tokyo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Vancouver and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Arequipa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Wellington and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Yokohama and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Mount Hagen and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Chicago and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Wellington and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Accra and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Berlin and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Mount Hagen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Cologne and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Mount Hagen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Cape

Coast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Munich and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Lille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Brasília and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Brasília and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across São Paulo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Christchurch and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Toulouse and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Lima and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Guadalajara and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Hyderabad and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map

drought exposure across Fukuoka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Iquitos and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Malindi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Washington, D.C. and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Guadalajara and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Chicago and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Los Angeles and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Belo Horizonte and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Phoenix and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Hyderabad and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Tauranga and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Kumasi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Salvador and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide

exposure across Chiclayo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Monterrey and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Hyderabad and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Birmingham and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Munich and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Nairobi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Vancouver and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Wellington and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Chiclayo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Kisumu and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Auckland and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Tokyo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide

exposure across Tema and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Puebla and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Calgary and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Cologne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Toulouse and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Kolkata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Osaka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across León and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Edmonton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Nagoya and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Kisumu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Kumasi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Cusco and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Yokohama and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A

planner might map earthquake exposure across Fortaleza and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Frankfurt and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Berlin and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Mumbai and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Glasgow and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Cusco and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Monterrey and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Chicago and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Perth and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Yokohama and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across New York and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Fukuoka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map landslide exposure across Buenos Aires and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Wuhan and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Mar del Plata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Buenos Aires and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Christchurch and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Kumasi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Auckland and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Goroka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Port Said and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Marseille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Chiclayo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Nairobi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake

exposure across Chiclayo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Hamburg and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Chennai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Buenos Aires and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Lima and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Frankfurt and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across León and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Luxor and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Arequipa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Guadalajara and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Tokyo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Hyderabad and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood

exposure across Shenzhen and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across León and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Accra and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Auckland and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Bristol and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Tijuana and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Monterrey and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Wuhan and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Canberra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Eldoret and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Edmonton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Shenzhen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Wellington and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across La Plata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A

planner might map storm surge exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Berlin and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Chiclayo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Nagoya and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Monterrey and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Montreal and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Auckland and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Berlin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Munich and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Auckland and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Sapporo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Shenzhen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge

exposure across Nagoya and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Birmingham and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Takoradi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Sydney and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Nagoya and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Paris and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Hamilton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Cusco and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Belo Horizonte and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Sapporo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Shenzhen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Chengdu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm

surge exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Wellington and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Guangzhou and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Sydney and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Dunedin and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Port Said and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Vancouver and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across São Paulo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Lima and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Mendoza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Chennai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge

exposure across Port Said and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Luxor and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Phoenix and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Chennai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Melbourne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Cairo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across São Paulo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Suez and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Frankfurt and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Kolkata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Fortaleza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Mexico City and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across New York and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map

landslide exposure across Accra and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Nagoya and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Shenzhen and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Phoenix and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Nagoya and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Cologne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Tokyo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Puebla and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Rio de Janeiro and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Accra and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Nagoya and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Tijuana and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map

landslide exposure across Takoradi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Tauranga and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Takoradi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Tamale and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Sydney and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Accra and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Monterrey and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Trujillo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Brasília and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Lima and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Osaka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Ottawa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Mombasa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Tamale and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Monterrey and test how transit-oriented

development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Lae and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Takoradi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Leeds and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Arequipa and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Belfast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Buenos Aires and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Belo Horizonte and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Adelaide and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Wellington and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Arequipa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Hyderabad and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner

might map earthquake exposure across Buenos Aires and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Munich and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Canberra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Accra and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Hamilton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Brasília and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Cardiff and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Edmonton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across New Delhi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Goroka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Lille and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Trujillo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Osaka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across New Delhi and test how risk-informed zoning changes expected

losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Sydney and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Belo Horizonte and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Córdoba and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Belfast and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Canberra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Takoradi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Puebla and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across London and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Hamburg and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Fukuoka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake

exposure across Cairo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Hamilton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Washington, D.C. and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Canberra and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Port Moresby and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across León and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Sydney and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Stuttgart and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Suez and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Sapporo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mendoza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Kumasi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner

might map storm surge exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Alexandria and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Suez and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Mar del Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Marseille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Mombasa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Cardiff and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Tamale and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Eldoret and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Calgary and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Tauranga and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across São Paulo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought

exposure across Kumasi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Nice and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Tokyo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Hamburg and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Port Moresby and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Los Angeles and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Nakuru and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Goroka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Christchurch and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Tokyo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Hamburg and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Eldoret and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map

drought exposure across Melbourne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Washington, D.C. and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Ottawa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Munich and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Canberra and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Suez and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Port Moresby and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Córdoba and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Mombasa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across New Delhi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Sapporo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Sydney and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Wellington and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Nakuru and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map

flood exposure across Edmonton and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Arequipa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Adelaide and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Luxor and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Sapporo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Fortaleza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Berlin and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Córdoba and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Córdoba and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Arequipa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Tauranga and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Frankfurt and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Wellington and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Suez and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map landslide exposure across Córdoba and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Lae and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Guangzhou and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Yokohama and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Guangzhou and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Buenos Aires and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Accra and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Córdoba and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Mexico City and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Berlin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Lae and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Rio de Janeiro and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Paris and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map flood exposure across New Delhi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Lae and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Tema and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Christchurch and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Madang and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Marseille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Cairo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Toulouse and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Cardiff and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Chengdu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Cologne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Brasília and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Berlin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map earthquake exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Nakuru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Salvador and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Luxor and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Brasília and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Port Said and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Tokyo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Puebla and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Auckland and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Toronto and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Kumasi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought

exposure across Cusco and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Christchurch and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Berlin and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Leeds and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Hamilton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Birmingham and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Buenos Aires and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Leeds and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Takoradi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Kumasi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Guadalajara and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Mar del Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner

might map earthquake exposure across Goroka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Munich and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Arequipa and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Rio de Janeiro and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Mombasa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Belfast and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across London and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across La Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Tijuana and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Stuttgart and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Melbourne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Chennai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Hyderabad and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Tauranga and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map

landslide exposure across Edmonton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Stuttgart and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Munich and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Sydney and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Cairo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Bengaluru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Tauranga and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Salvador and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Edinburgh and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Edmonton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Takoradi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Tokyo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

drought exposure across Tema and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Kisumu and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Luxor and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Mar del Plata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method

focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Takoradi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Nakuru and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Los Angeles and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Chennai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Paris and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Tamale and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Birmingham and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner

might map earthquake exposure across Monterrey and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Berlin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Adelaide and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Chicago and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Trujillo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Edinburgh and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Arequipa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across New Delhi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Dunedin and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map storm surge exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Fortaleza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Tijuana and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Córdoba and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Beijing and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Lille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Port Moresby and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Mendoza and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Hamburg and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Kisumu and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Suez and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Toulouse and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Port Said and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Wellington and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Houston and test how

water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Calgary and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Marseille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Kimbe and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Fukuoka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Perth and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Phoenix and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Córdoba and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Edinburgh and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Tokyo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Mendoza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A

planner might map flood exposure across New York and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Paris and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Mendoza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Chengdu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Berlin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Houston and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Alexandria and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Tema and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Guangzhou and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Chiclayo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Córdoba and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Tokyo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Wellington and test how building-code enforcement

changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Tijuana and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Frankfurt and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method

focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Cusco and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Ottawa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Nagoya and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Frankfurt and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across New Delhi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a

physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Puebla and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Sheffield and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Houston and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Trujillo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Puebla and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Wellington and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across La Plata and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Christchurch and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local

knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Houston and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Wuhan and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a

physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Mexico City and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Calgary and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Leeds and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Port Moresby and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty

bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Paris and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Mendoza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Chiclayo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion

patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Madang and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Kolkata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Berlin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Shanghai and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography

perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Nice and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Shanghai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Mexico City and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across León and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Cologne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and

qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Osaka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Chicago and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tijuana and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Adelaide and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support

evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Berlin and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Monterrey and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Takoradi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Beijing and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Eldoret and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a

physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Edinburgh and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Port Moresby and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Hamilton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Dunedin and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local

stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Perth and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Wellington and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Brasília and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across León and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to

evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Belo Horizonte and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Vancouver and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Takoradi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Cologne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Belo Horizonte and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization.

From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Hamilton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Shanghai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Adelaide and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Montreal and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Vancouver and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and

qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Shenzhen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Perth and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Auckland and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across New Delhi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to

evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Hamilton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Rosario and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Beijing and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography

perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Guangzhou and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Chennai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Paris and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Wuhan and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Munich and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across New Delhi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Wuhan and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude

gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Takoradi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Mumbai and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across New York and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Tokyo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply,

hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Iquitos and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across La Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Mendoza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Iquitos and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Guadalajara and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Luxor and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Marseille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and

high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Toulouse and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Suez and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Eldoret and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Buenos Aires and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Fukuoka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply,

hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Chiclayo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Perth and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Kolkata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Kolkata and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Paris and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Los Angeles and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Accra and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude

gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Trujillo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Leeds and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Cologne and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Guangzhou and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Goroka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water

supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Bengaluru and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Bengaluru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Takoradi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Auckland and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Manchester and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Chiclayo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Salvador and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean

currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across New York and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Port Said and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Guangzhou and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Iquitos and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Mar del Plata and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply,

hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Toulouse and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Tokyo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Lille and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Ottawa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Berlin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across La Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Monterrey and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a

neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Mombasa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Mexico City and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Tokyo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Tokyo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Port Moresby and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Melbourne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Cape Coast and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Madang and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Port Moresby and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Munich and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Ottawa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Mar del Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Kumasi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Belo Horizonte and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion,

deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across La Plata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Suez and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Toronto and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Fortaleza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Washington, D.C. and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Lille and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Tijuana and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across New Delhi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Eldoret and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Calgary and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Glasgow and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Hamilton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Luxor and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition,

glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Birmingham and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Melbourne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Mendoza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Iquitos and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Liverpool and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across São Paulo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Arequipa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Vancouver and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Lima and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Perth and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Melbourne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Wellington and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Paris and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Canberra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a

neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Toronto and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Chicago and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Melbourne and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Giza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Eldoret and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Leeds and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Nairobi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Brasília and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Accra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Perth and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Phoenix and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Trujillo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Nagoya and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear

clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Ottawa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Bengaluru and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Fukuoka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Chicago and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Fortaleza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Salvador and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across New Delhi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Kolkata and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Beijing and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Rosario and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Montreal and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across La Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Córdoba and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network

connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tema and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Manchester and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tauranga and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Tauranga and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Giza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Mount Hagen and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across New Delhi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Auckland and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Cairo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Guangzhou and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Mombasa and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Fortaleza and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Mexico City and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Yokohama and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a

neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Lille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Nice and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Tokyo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Sheffield and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Shanghai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water

supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Chennai and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Hamburg and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Calgary and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Adelaide and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Houston and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Rio de Janeiro and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Belo Horizonte and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Takoradi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Chiclayo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host

governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Frankfurt and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Takoradi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Leeds and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Lille and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Sydney and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms

influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Christchurch and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Shanghai and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Osaka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Arequipa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Eldoret and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Belo Horizonte and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Goroka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Cape Coast and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm

surge exposure across Fukuoka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Accra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Cardiff and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Giza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Rosario and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Perth and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Nagoya and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Toulouse and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Brasília and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Phoenix and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Stuttgart and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Hamilton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets.

Applied note: A planner might map flood exposure across Brasília and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Wuhan and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Monterrey and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Giza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Port Said and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Marseille and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Sydney and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Takoradi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Washington, D.C. and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Hyderabad and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Brasília and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm

surge exposure across Alexandria and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Houston and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Chicago and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Kimbe and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Hamburg and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Cusco and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Kisumu and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Cologne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Lima and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Cologne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Mexico City and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Tema and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Buenos Aires and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity.

Applied note: A planner might map landslide exposure across Madang and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Canberra and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Toronto and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Birmingham and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across New Delhi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Tema and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Marseille and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Osaka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Goroka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Kumasi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Sheffield and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Buenos Aires and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Mumbai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Wellington and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood

exposure across Trujillo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Wuhan and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Córdoba and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Beijing and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Paris and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Manchester and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Sheffield and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Mendoza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Sapporo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Bristol and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Kumasi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm

surge exposure across Shenzhen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Hamilton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Hamburg and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Chiclayo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Wuhan and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across León and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Calgary and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Malindi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Takoradi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Tijuana and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Suez and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Nairobi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied

note: A planner might map heatwave exposure across Phoenix and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Paris and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Kumasi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Eldoret and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Tamale and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Mendoza and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Nakuru and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Los Angeles and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Iquitos and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Mount Hagen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Cologne and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Osaka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Rosario and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner

might map heatwave exposure across Auckland and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Kisumu and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Cardiff and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Beijing and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Edmonton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Guangzhou and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Mount Hagen and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Mount Hagen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Munich and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Kolkata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Bristol and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Calgary and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Goroka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Auckland and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought

exposure across Yokohama and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Lille and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Dunedin and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Toulouse and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Tijuana and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Edinburgh and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Osaka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Iquitos and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Iquitos and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Edmonton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Sheffield and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Lille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Bengaluru and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought

exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Kisumu and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Lyon and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Vancouver and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Port Said and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across São Paulo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Adelaide and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across León and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across New York and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Mar del Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Guadalajara and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Chiclayo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Shanghai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Wellington and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood

exposure across Nice and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Kolkata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Luxor and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Chicago and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Nakuru and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space.

Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Wellington and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Mendoza and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Marseille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Leeds and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Chennai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Suez and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Christchurch and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Salvador and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood

exposure across Nairobi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Dunedin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across La Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Tijuana and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Cologne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Cardiff and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Lima and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Cairo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Tokyo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Manchester and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Liverpool and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Goroka and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Berlin and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Ottawa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought

exposure across Toulouse and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across New Delhi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Salvador and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Ottawa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Calgary and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Brisbane and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Puebla and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Kumasi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Accra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Puebla and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across La Plata and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Kolkata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Córdoba and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map

storm surge exposure across Lille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Houston and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Hyderabad and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Brasília and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Perth and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Phoenix and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Buenos Aires and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Tamale and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Leeds and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Lima and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Ottawa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Tijuana and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity.

Applied note: A planner might map landslide exposure across Edinburgh and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Kisumu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Houston and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Toronto and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Yokohama and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Berlin and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Stuttgart and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Tamale and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Chennai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Birmingham and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Guangzhou and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Chengdu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Mexico City and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Hamilton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map earthquake exposure across Melbourne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Brisbane and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Salvador and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Malindi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across La Plata and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Mumbai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Madang and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Wuhan and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Calgary and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Sheffield and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Phoenix and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Edmonton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Brasília and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave

exposure across Shenzhen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Berlin and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Giza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Luxor and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mexico City and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Cape Coast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Guadalajara and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Vancouver and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Port Moresby and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Osaka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Canberra and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Christchurch and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Munich and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Chennai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A

planner might map drought exposure across Sheffield and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Christchurch and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Cusco and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Lae and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Nagoya and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Suez and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Birmingham and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Nagoya and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Montreal and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Luxor and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Luxor and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Brisbane and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Los Angeles and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide

exposure across Shenzhen and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Cardiff and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across New York and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Birmingham and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Christchurch and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Vancouver and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across La Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Nagoya and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Osaka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Mombasa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Tijuana and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Munich and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across La Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide

exposure across Tamale and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Trujillo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Beijing and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Nairobi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Guadalajara and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Trujillo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Alexandria and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Fukuoka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Toronto and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Accra and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Wuhan and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Belo Horizonte and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Adelaide and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity.

Applied note: A planner might map drought exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Lille and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Mar del Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Edinburgh and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Kisumu and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Fukuoka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Nakuru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Sheffield and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Arequipa and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Kimbe and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Osaka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Monterrey and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Monterrey and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood

exposure across Shenzhen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Eldoret and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Madang and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Lae and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Hamilton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Alexandria and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Hyderabad and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Iquitos and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Dunedin and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Cairo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Córdoba and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Toronto and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Glasgow and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Dunedin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map storm surge exposure across Port Moresby and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Cape Coast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Giza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Accra and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Berlin and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Leeds and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Mumbai and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Guadalajara and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Goroka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Nakuru and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Accra and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map heatwave exposure across Chengdu and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Mar del Plata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Eldoret and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Stuttgart and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Toulouse and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Manchester and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Melbourne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Lyon and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Chengdu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Buenos Aires and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Lima and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Lima and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Chicago and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A

planner might map earthquake exposure across Monterrey and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Berlin and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Malindi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Rio de Janeiro and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Wuhan and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Córdoba and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Belo Horizonte and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Paris and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Phoenix and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Liverpool and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Bristol and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Auckland and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across La Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity.

Applied note: A planner might map landslide exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Berlin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Córdoba and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Canberra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Córdoba and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Shenzhen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Puebla and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Edmonton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Melbourne and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Mexico City and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Puebla and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Córdoba and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought

exposure across Lima and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Sheffield and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across León and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Luxor and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Arequipa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Lima and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Iquitos and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Tokyo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Kumasi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Cologne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Malindi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Edmonton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Tijuana and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity.

Applied note: A planner might map landslide exposure across Port Moresby and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Calgary and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Lyon and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Nakuru and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Ottawa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Paris and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Port Said and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Cardiff and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Yokohama and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Washington, D.C. and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Melbourne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Toulouse and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mar del Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

storm surge exposure across Eldoret and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Frankfurt and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Montreal and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Monterrey and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Phoenix and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Kimbe and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Vancouver and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Hamilton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Fortaleza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Lae and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Iquitos and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Malindi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Montreal and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map landslide exposure across New York and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Port Moresby and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Bristol and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Hamilton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Houston and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Nagoya and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Chicago and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Cusco and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Monterrey and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Shenzhen and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Nairobi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Fukuoka and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave

exposure across Tokyo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Tema and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Melbourne and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Kisumu and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across La Plata and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Kimbe and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Dunedin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Yokohama and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Takoradi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Chengdu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Yokohama and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Wellington and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Mar del Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A

planner might map heatwave exposure across Cardiff and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Christchurch and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Chengdu and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Wellington and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Mumbai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Frankfurt and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Belo Horizonte and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Washington, D.C. and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across New York and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across La Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Frankfurt and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner

might map flood exposure across Melbourne and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tokyo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Toronto and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Arequipa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Bengaluru and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Melbourne and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Fukuoka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Chiclayo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Cardiff and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Toronto and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Iquitos and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Tokyo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Nairobi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave

exposure across Toronto and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Chennai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Luxor and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Kimbe and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Christchurch and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Mumbai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across León and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Hyderabad and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Munich and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Chicago and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Sheffield and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Brasília and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Chennai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner

might map storm surge exposure across Lae and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Guangzhou and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Wellington and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Canberra and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Kumasi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Liverpool and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Leeds and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Eldoret and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Berlin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Nagoya and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Cusco and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Suez and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Lille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Manchester and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map

storm surge exposure across Marseille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Mar del Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Puebla and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across São Paulo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Birmingham and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Port Said and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Guadalajara and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Brisbane and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Belfast and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Stuttgart and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Ottawa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Luxor and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Salvador and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge

exposure across Tamale and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Puebla and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Buenos Aires and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Sydney and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Tijuana and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Wuhan and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Houston and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Canberra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Cardiff and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Glasgow and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Mumbai and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Mendoza and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Phoenix and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Kolkata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Lille and

test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Arequipa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Shanghai and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Iquitos and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Alexandria and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Tijuana and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Yokohama and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Monterrey and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Monterrey and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Mexico City and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across León and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Hyderabad and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Accra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Sydney and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets.

Applied note: A planner might map earthquake exposure across Canberra and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Fukuoka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Chicago and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Sheffield and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Guadalajara and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across New York and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across London and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Adelaide and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Dunedin and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Tijuana and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Córdoba and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Leeds and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Kumasi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

flood exposure across New Delhi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Tokyo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Chengdu and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Brisbane and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Houston and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Glasgow and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across São Paulo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Nairobi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Kisumu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Belo Horizonte and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Bengaluru and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Los Angeles and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Fortaleza and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge

exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Kimbe and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Calgary and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Auckland and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Rio de Janeiro and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Monterrey and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Wellington and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Cusco and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Nakuru and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Leeds and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Mar del Plata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Giza and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Christchurch and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought

exposure across Ottawa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Tamale and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Belo Horizonte and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Fukuoka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Cairo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Kisumu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Leeds and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Eldoret and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Cardiff and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Yokohama and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Guangzhou and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across La Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Canberra and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Christchurch and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A

planner might map earthquake exposure across Hamilton and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Monterrey and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Mexico City and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across New Delhi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Guangzhou and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Luxor and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Cairo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Guangzhou and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Fortaleza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Marseille and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Canberra and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Auckland and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Phoenix and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave

exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across São Paulo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Sydney and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across São Paulo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Lyon and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Bristol and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Edinburgh and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Chiclayo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Chiclayo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across São Paulo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Chengdu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Monterrey and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Munich and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note:

A planner might map heatwave exposure across Kimbe and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Mumbai and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Cape Coast and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Takoradi and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Montreal and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Salvador and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Mount Hagen and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Eldoret and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Fortaleza and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Arequipa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across New York and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Washington, D.C. and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm

surge exposure across Iquitos and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Christchurch and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Nakuru and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across New York and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Salvador and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across León and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Kolkata and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Luxor and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Malindi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Toulouse and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Alexandria and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Eldoret and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Edmonton and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map flood exposure across Hamilton and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Arequipa and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Accra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Dunedin and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Manchester and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Calgary and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Iquitos and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Suez and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Sapporo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Iquitos and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Brisbane and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Fortaleza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Cairo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide

exposure across Edmonton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Melbourne and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Kisumu and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Kolkata and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Tijuana and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Mombasa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Ottawa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Salvador and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Wellington and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Brisbane and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Houston and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Shenzhen and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Lima and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map flood exposure across Nice and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Guangzhou and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Chengdu and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Edmonton and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Stuttgart and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Madang and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Giza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Tijuana and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Marseille and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Vancouver and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across León and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Alexandria and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Mumbai and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Salvador and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map

landslide exposure across Luxor and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Lille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Takoradi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Los Angeles and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Brasília and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Malindi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Beijing and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Osaka and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Belfast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Kisumu and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across New York and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Wuhan and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Madang and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

drought exposure across Guangzhou and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Perth and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Frankfurt and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Nice and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Leeds and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Tamale and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Rosario and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Puebla and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Chicago and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Glasgow and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Melbourne and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Suez and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Hamburg and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Cardiff and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner

might map earthquake exposure across Mendoza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Alexandria and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Toulouse and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Monterrey and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across La Plata and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Marseille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Shanghai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Ottawa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Hamilton and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Nice and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Kimbe and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Mexico City and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Christchurch and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A

planner might map storm surge exposure across Mexico City and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Córdoba and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Los Angeles and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Rosario and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Adelaide and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Wuhan and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Tema and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Salvador and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across New York and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Nagoya and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Iquitos and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map flood exposure across Ottawa and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A

planner might map storm surge exposure across Canberra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Arequipa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Toulouse and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Goroka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Goroka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Toronto and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Alexandria and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Takoradi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across León and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Mount Hagen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Guadalajara and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Suez and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Brasília and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Iquitos and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map

earthquake exposure across Malindi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Tema and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Sheffield and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Tamale and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Guadalajara and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method

focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Paris and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Munich and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Takoradi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Manchester and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Kumasi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Leeds and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Kolkata and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Hamburg and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Fukuoka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Iquitos and test how risk-informed zoning changes expected losses. A geographer

would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Port Said and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Madang and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Eldoret and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Chengdu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across

metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Tijuana and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Lae and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Guangzhou and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Toronto and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Kisumu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across São Paulo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Calgary and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Marseille and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Tauranga and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner

might map flood exposure across Mendoza and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Calgary and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Perth and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Takoradi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Washington, D.C. and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Chiclayo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Canberra and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Dunedin and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Nagoya and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Chiclayo and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Tokyo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map storm surge exposure across Cape Coast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Cape Coast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Hamilton and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Lae and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Vancouver and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Fukuoka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Houston and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Tijuana and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Nairobi and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Rio de Janeiro and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Chennai and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Fortaleza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across São Paulo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map

storm surge exposure across Puebla and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Washington, D.C. and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Eldoret and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map drought exposure across Washington, D.C. and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Kisumu and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Bengaluru and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Wellington and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Lae and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Lille and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Washington, D.C. and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Munich and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Shanghai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Lille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Chengdu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map

earthquake exposure across Berlin and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Belo Horizonte and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Brasília and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Los Angeles and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Adelaide and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Lille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Chengdu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Toulouse and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Puebla and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Paris and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Perth and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Cape Coast and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Wuhan and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave exposure across Canberra and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map

heatwave exposure across Malindi and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Kumasi and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Buenos Aires and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Tauranga and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Kisumu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method

focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Beijing and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map landslide exposure across Perth and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Tauranga and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Brasília and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Shanghai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Toronto and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Hamburg and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across New York and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Chennai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood

exposure across Kisumu and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Nakuru and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Goroka and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Kumasi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they

analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Munich and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Ottawa and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map heatwave exposure across Mumbai and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Toulouse and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Chennai and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Eldoret and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across León and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Rosario and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity.

Applied note: A planner might map flood exposure across Córdoba and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Munich and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Arequipa and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Sheffield and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across São Paulo and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Tokyo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Auckland and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Wuhan and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Alexandria and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Suez and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Marseille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Cairo and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Cologne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Giza and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map heatwave

exposure across Osaka and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Eldoret and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Nakuru and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Calgary and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Auckland and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Belfast and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Sheffield and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Frankfurt and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Chicago and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Kisumu and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm surge exposure across Kolkata and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Mendoza and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Hyderabad and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge

exposure across Marseille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Rio de Janeiro and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across London and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Yokohama and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Yokohama and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Madang and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Córdoba and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Auckland and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map drought exposure across Marseille and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Beijing and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Canada). Capital city Ottawa and major centers such as Toronto, Montreal, Vancouver illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Vancouver and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Paris and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Belo Horizonte and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across New Delhi and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner

might map storm surge exposure across Arequipa and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map earthquake exposure across Alexandria and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Shenzhen and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Malindi and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map heatwave exposure across Kisumu and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Osaka and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Suez and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Shenzhen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Mumbai and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — United Kingdom). Capital city London and major centers such as Birmingham, Manchester, Glasgow illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Sheffield and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map storm surge exposure across Christchurch and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map flood exposure across Perth and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Port Said and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Beijing and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might

map landslide exposure across Cologne and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — India). Capital city New Delhi and major centers such as Mumbai, Bengaluru, Kolkata illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map landslide exposure across Kolkata and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Port Said and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map drought exposure across Mount Hagen and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Frankfurt and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — United States). Capital city Washington, D.C. and major centers such as New York, Los Angeles, Chicago illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography

perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Phoenix and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Kenya). Capital city Nairobi and major centers such as Mombasa, Kisumu, Nakuru illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map drought exposure across Nakuru and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Hamburg and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across São Paulo and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map earthquake exposure across Tema and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Mar del Plata and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across Yokohama and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map landslide exposure across Giza and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map heatwave exposure across Wuhan and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map storm

surge exposure across Paris and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Puebla and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map drought exposure across Marseille and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map earthquake exposure across Guadalajara and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Marseille and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — China). Capital city Beijing and major centers such as Shanghai, Shenzhen, Guangzhou illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method

focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Shenzhen and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Brazil). Capital city Brasília and major centers such as São Paulo, Rio de Janeiro, Salvador illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map landslide exposure across Belo Horizonte and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map landslide exposure across Arequipa and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map flood exposure across Brisbane and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — New Zealand). Capital city Wellington and major centers such as Auckland, Christchurch, Hamilton illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map landslide exposure across Auckland and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Argentina). Capital city Buenos Aires and major centers such as Córdoba, Rosario, Mendoza illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map drought exposure across Rosario and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Egypt). Capital city Cairo and major centers such as Alexandria, Giza, Port Said illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map flood exposure across Luxor and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map earthquake exposure across Cusco and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (South America — Peru). Capital city Lima and major centers such as Arequipa, Cusco, Trujillo illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Cusco and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map

flood exposure across Berlin and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map earthquake exposure across Sapporo and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Australia). Capital city Canberra and major centers such as Sydney, Melbourne, Brisbane illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map storm surge exposure across Adelaide and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Marseille and test how green infrastructure changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Australia & Oceania — Papua New Guinea). Capital city Port Moresby and major centers such as Lae, Mount Hagen, Madang illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Scale affects interpretation: patterns can appear clustered at a neighborhood scale but diffuse at a national scale. Applied note: A planner might map storm surge exposure across Port Moresby and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze

migration, housing markets, and employment accessibility across metropolitan space. Method focus: Fieldwork and surveys contextualize model outputs, capturing lived experience and local knowledge. Concept focus: Urban systems form hierarchies: capitals often host governance and high-order services, while secondary cities specialize. Applied note: A planner might map storm surge exposure across Cape Coast and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: GIS overlays land use, elevation, flood zones, and population to evaluate risk and plan interventions. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map earthquake exposure across Cape Coast and test how water-demand management changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Africa — Ghana). Capital city Accra and major centers such as Kumasi, Tamale, Takoradi illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Spatial statistics detect clustering, hot spots, and diffusion patterns to support evidence-based planning. Concept focus: Climate drivers such as monsoons, ocean currents, and altitude gradients influence water availability and agriculture. Applied note: A planner might map heatwave exposure across Tamale and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — France). Capital city Paris and major centers such as Marseille, Lyon, Toulouse illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map storm surge exposure across Nice and test how risk-informed zoning changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (North America — Mexico). Capital city Mexico City and major centers such as Guadalajara, Monterrey, Puebla illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Accessibility combines distance, travel time, cost, and network connectivity; it strongly predicts economic opportunity. Applied note: A planner might map flood exposure across León and test how early warning systems changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Asia — Japan). Capital city Tokyo and major centers such as Osaka, Yokohama, Nagoya illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Physical processes—erosion, deposition, glaciation, tectonics—shape landforms and hazard exposure. Applied note: A planner might map heatwave exposure across Sapporo and test how building-code enforcement changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.

Extended note (Europe — Germany). Capital city Berlin and major centers such as Hamburg, Munich, Cologne illustrate urban hierarchy and functional specialization. From a physical geography perspective, researchers examine how climate variability and landforms influence water supply, hazard exposure, and ecosystem services. From a human geography perspective, they analyze migration, housing markets, and employment accessibility across metropolitan space. Method focus: Remote sensing compares images through time to quantify deforestation, urban expansion, and drought stress. Concept focus: Spatial inequality can be studied through service access, housing affordability, exposure to hazards, and labor markets. Applied note: A planner might map flood exposure across Hamburg and test how transit-oriented development changes expected losses. A geographer would then interpret results using uncertainty bounds and qualitative insight from local stakeholders.
